

Below are the 3 options on the electrical outlets we can use and some pictures of the different outlets.

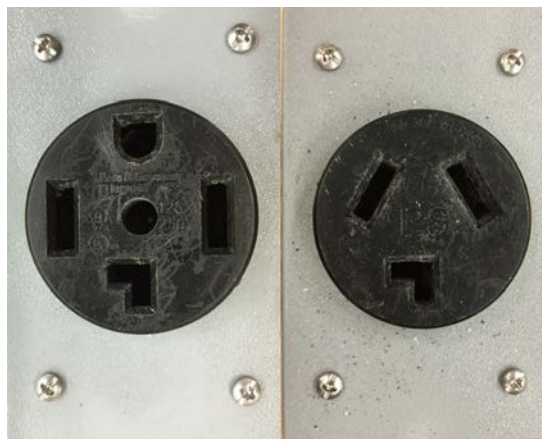

We prefer option #1 or #2 if possible.

Option # 1

We can use the following 4 prong outlet just so it is within 100 feet of the stage area.

We cannot use the outlets below.

Option # 2

Below are pictures of my pigtail that I bring with me that you can hook into your fuse box on a 40 or 50 amp circuit. I would need someone from your church that knows what they are doing to hook this in before the event. Usually this should be done about one or two hours after setup begins.

Option # 3

I can run extension cords around the building to 5 different circuits. I would need to know how the outlets in the building are divided into circuits. If I plug in too much of my equipment into one circuit it will blow a fuse. In some buildings all the outlets in a room are on one circuit.

We prefer Option one or two. Option # three should only be a last resort if options one or two absolutely cannot be used.

Thank you for your cooperation in this matter. It will help everything to run much smoother if this is in place.

I hope this is a help to you. Please feel free to contact me if you have any other questions.

God Bless You

Jerry Moyer
